

OSS-Next Completion Audit — Task List

Generated 2026-07-31 · Branch `integrate-wp-render` · Full \$3 three-dimension pass
Living source: `docs/audits/AUDIT_REQUIREMENTS.md` \$5-\$6 · Previous: `AUDIT_TASK_LIST_2026-07-24.pdf`

This was a real methodology pass — three parallel scans (Functional Completeness, E-Commerce Feature Coverage, CWV/SEO) verifying against the live code, not a delta. **The Django checkout crash (B1) is fixed and verified live** — a real POST now returns 201 with an order. That was the single blocker to an end-to-end purchase.

Scores

Dimension	07-31	07-24	07-21	07-15
Overall (blended)	~88%	~83%	~81%	~65%
Functional Completeness (8 areas)	~93%	~90%	~88%	~62%
E-Commerce Feature Coverage (41 items)	~83%	~64%	~64%	~65%
Core Web Vitals / PageSpeed / SEO	~91%	~91%	~91%	~68%

Progress: 53 done · 0 partial · 5 open (was 51 / 0 / 5 on 2026-07-24)

Feature Coverage jumped ~64% → ~83% not because features were added, but because it's now scored on an *is-it-addressed* basis. The old number counted every client-excluded item (recently-viewed, comparison, multi-payment, account-deletion, tracking, stock/price alerts, multi-address) as an uncovered gap. Real tally: **28/41 done, 7 not-required (client-confirmed), 4 partial-by-design, 2 real gaps** (live chat, coupons).

Verified LIVE This Pass

- **Checkout end-to-end unblocked** — backend returns 201; our wiring (server-recomputed amount, charged-but-no-order guard, `status:"paid"`) consumes it unchanged.
- **All 8 in-scope areas LIVE** — Home, PDP, PLP, My Account + subpages, Login/Register, Cart, Checkout. Real data, real backend calls, no placeholders except the known QuoteForm.
- **New features LIVE** — headless blog (list/detail/search/pagination/JSON-LD), WP catch-all pages, maintenance wall (Redis toggle + control page).
- **CWV/SEO ~91%** — metadata + canonicals on every page, JSON-LD (Organization/WebSite, Product+aggregateRating, BreadcrumbList, BlogPosting), zero raw `<img>`, next/font, broad `'use cache'` with profile variety.

Fixed This Pass (blog audit findings)

- **Duplicate `<main>`** in both blog pages (nested in the layout's) — a11y regression, now `<div>`.
- **Blog absent from the sitemap** — `/blogs` + every post now emitted (verified: index + 50 posts).
- **Blog content not script-stripped** — would reintroduce the reCAPTCHA nav-crash class; now strips `<script>` / `<iframe>`.
- **Blog in-body images unoptimized** — now `loading=lazy / decoding=async`.

Open — 5 items (none ours to unilaterally close)

BACKEND Pages API serves malformed CSS

Minifier strips comment delimiters but keeps the text and emits unbalanced braces; browsers discard every rule after the fault, so the live WordPress site loses styling too. Worked around with a tolerant parser here; the source needs a Django-side fix.

CLIENT Homepage quote form silently discards leads

Shows "✓ Quote Request Sent" while the data goes nowhere. Fix is Zoho Forms — waiting on account details. Interim: disable the form or drop the success message.

CLIENT Site advertises live chat that doesn't exist

Trust strip promises "Phone, Email & Chat." Decide to build chat, or approve a one-line copy change (needs no engineering decision).

VERIFY Home WebSite SearchAction target

Homepage JSON-LD SearchAction points at `onsitestorage.com/products?q=`. The JSON-LD describes the production WordPress site (all @ids use that domain) so it may be correct there; this app has no `/products` route. Very low severity — confirm production has the search endpoint, then keep or remove.

DELIBERATE PLP cards don't set an image priority hint

The cards render through the search library's list component, which exposes no item index; marking the first card would mean replacing it and risking pagination/empty-state regressions, for a minor hint on post-hydration content. Left as-is on purpose.

Worth Doing (not blocking)

Item	Why
One real end-to-end sandbox transaction	Confirms the populated <code>Order</code> response shape and whether <code>payment_status</code> flips on a verified Braintree charge (B2). Now possible since B1 is fixed.
