

OSS-Next — Blockers Report

2026-07-31 · Branch `integrate-wp-render`

What is blocked, who can unblock it, and exactly what is needed.

The checkout crash (B1) is fixed — a real POST now returns 201 with an order. That was the single blocker to an end-to-end purchase, and it's cleared. With Braintree sandbox credentials also in place, checkout should work start to finish. What remains is **two backend items and two client decisions** — none of them block the core purchase flow.

Owner	Open	Nature
Backend team	2	One CSS-pipeline fix + one payment-status confirmation
Client	2	Business decisions; no engineering blocked behind them
Frontend	0	Nothing actionable outstanding — 4 blog issues fixed this pass

Backend

B2 · CONFIRM Order status & transaction verification

Checkout now returns 201 with `status:"paid"` (the value we send) and a separate `payment_status:false` for an unverified transaction — good: the backend isn't trusting an unverified transaction. What's unconfirmed is whether `payment_status` flips to `true` on a *real, verified* Braintree charge, and whether the persisted `transaction_id` is traceable.

What we need: confirm the backend verifies `transaction_id` against Braintree and sets `payment_status` accordingly. Best settled by one real end-to-end sandbox transaction (now possible since B1 is fixed).

B3 The pages API serves malformed CSS

The CSS minifier strips `/* */` delimiters but leaves the comment text, and emits unbalanced braces. Strict parsers reject it; browsers discard every rule after the fault, so the live WordPress site loses styling too. We work around it with a tolerant parser, but the source is wrong.

What we need: fix the minifier so comments are removed whole and braces stay balanced.

Client Decisions

Neither blocks engineering. Both carry active customer-facing risk, and both have a cheap interim mitigation that needs no product decision.

C1 · CUSTOMER-FACING RISK The homepage quote form silently discards submissions

The form shows "✓ **Quote Request Sent — We'll be in touch!**" while the customer's details go **nowhere**. Every lead is lost, and the visitor believes they've contacted the business.

What we need: the Zoho Forms account and form details. **Until then, disable the form or remove the success message** — the current behaviour is worse than no form.

The homepage trust strip promises "Phone, Email & Chat" support. There's no chat feature, and none planned.

What we need: a decision to build chat, or approval to change the copy. **The copy fix takes minutes and needs no engineering decision.**

Cleared Since the 2026-07-24 Report

Item	Outcome
Django checkout crash (was the top blocker)	Fixed by backend; verified live (201 + order, no locale error).
Blog: duplicate <main>, missing sitemap, un-stripped scripts, unoptimized images	All four fixed this pass (frontend).

Not Blocked, Noted

Item	Status
Home WebSite SearchAction target	Very low severity; JSON-LD describes the production site — verify it has <code>/products</code> search, then keep or remove.
Coupons / live chat as storefront features	Deliberately absent / pending client; not defects.
PLP image-priority hint	Deliberate — search library exposes no item index; minor CWV nit on post-hydration content.

Generated 2026-07-31 from `docs/audits/AUDIT_REQUIREMENTS.md`, `API_INTEGRATION_STATUS.md` and `API_TRIGGER_CHECKLIST.md`. The `.md` files are the living versions. Supersedes `BLOCKERS_2026-07-24.pdf`. All backend findings were reproduced against the live backend, not inferred from code.
