

Updates

oss_pages storefront

Period	2026-09-02 to 2026-09-08
Shipped to production	10
On branches, not shipped	1
Generated	2026-09-08 13:58 UTC

Shipped

On integrate-wp-render, mirrored to oss-next/main. These are live.

2026-09-04 Derive PDP resources from the container's own specs

90b4fc1

The resources row was three hand-written links per size, most of them pointing at "#". It now derives its own filenames from the active product's size, condition and grade, against the files actually present under public/resources/pdp/ -- so a correctly-named file becomes live without anyone editing a list, and a combination with no file shows no button rather than a link to a 404.

2026-09-04 Ask for contact details where a quote is being asked for

60403be

Delivery is priced per address and quoted by a person, so an order from someone we cannot reach is a cart that sits there. Until now the ask happened at Add to cart, which is the wrong moment: it stops a purchase to collect details nobody needs yet, and it is the point in the funnel where an interruption costs the most.

2026-09-04 Stop the Full Name label sitting 11px low

a881c3d

The label is positioned `inset-y-0` against its wrapper, so the wrapper has to be exactly the input's height. Full Name is a direct grid cell and was stretching to 70px to match the Phone cell beside it, which is taller because of the note under its input -- leaving the label centred in 70px against a 48px field.

2026-09-08 Fix six dependency CVEs, and stop the next key reaching a remote

6421b94

Batch 1 of the security remediation: the findings that needed no decision. `npm audit fix` only -- every upgrade in range, package.json untouched, so the whole change is package-lock.json.

.githubhooks/pre-commit, .githubhooks/scan-staged.mjs, .github/workflows/secret-scan.yml, .gitignore, docs/security_audit/batches/batch-1.json, docs/security_audit/remediation-report.pdf, package-lock.json, package.json, +1 more

2026-09-08 Make the hooks-path prepare script cross-platform

f78bf68

`|| true` is a POSIX idiom, and npm runs scripts through cmd.exe on Windows where `true` is not a command. On a Windows checkout with no .git directory -- a downloaded zip -- prepare would fail and take npm install down with it. A node one-liner swallows the failure everywhere.

package.json

2026-09-08 Upgrade Next to 16.3.4 -- zero known vulnerabilities

1010613

Batch 2: the decision batch 1 deferred. npm reported the fix as "outside the stated dependency range" only because package.json pinned 16.2.7 exactly; 16.3.4 is a minor within Next 16, not a major. postcss and sharp are pinned by Next's own tree, which is why all three moved together or not at all.

2026-09-08 Require a delivery ZIP before the quote can be submitted

3ca1e9e

The destination was the one thing the flow never checked. `submitDeliveryQuote` validated name, email, confirmation and phone, then sent the lead and redirected to the review page regardless of whether a ZIP had been set -- so it was possible to reach step 4 and be shown "Not set yet" as the destination and "Add a ZIP code to see this" in place of the delivery charge. That is the one number the whole flow exists to produce, and a lead reaching sales without it cannot be quoted.

2026-09-08 Add to cart from the PDP, without the detour to the quote form

95b7748

Clicking Add to cart on a reference listing did not add anything -- it pushed the visitor to /get-exact-delivery-quote, and `addSelectedToCart` refused the item a second time behind that. The reasoning was that a listing with no depot and no real SKU cannot honestly be sold, but answering "add this to my cart" with a contact form is its own kind of dishonest, and it is the answer a visitor gets on the listings this catalogue has most of.

2026-09-08

Ask where the visitor is instead of a dead Add to cart

f0ce155

A listing in the "Generic Product Page" category has no depot behind it, so `addSelectedToCart` bails out early. With the button still rendered and enabled, pressing it did nothing at all -- a dead control, on the one action the whole panel is built around.

2026-09-08

Let the ZIP reach every component that reads it

f7fbef7

Answering "Get the Best Price on Your Container!" wrote the new location to storage and swapped the product, but the delivery field beside it went on showing the old ZIP. Three separate reasons, all of which had to go.

Restyle the ordering panel: hairlines instead of chrome

9072668 - branch: ai-suggested-pdp

The panel was five button languages, five corner radii, four inset shadow stacks and nine one-off hexes, with three different pictures of "selected" depending on which row you were in and how wide the window was. It read dated because it was: a glossy bevel is a 2010s device, and there were thirteen of them behind the figures a customer is trying to compare.
